Email: contact@oxylusflash.ro

Support only on our public forum: <http://forum.oxylusflash.com/slick-full-website-template-cms-2-skins/>

Server Requirements

Php 4+ / Php 5+ (with gd 2.0)

Mysql 4+

Installing the site files

Step 1 – Copy Files:

Copy all the files and folders inside the **\3 - Template with Admin Panel** folder from the downloaded pack to your website root folder (via FTP or sFTP depending on what you use). Please try avoiding uploading with your web browser, we suggest **Total Commander** (see FAQ for free download link).

Step 2 - Configure Database:

Create the database on your server and then put your information in "admin/mysql.php" :

```
$_CONF["database"] = array(  
    "type"           => "mysql",  
    "server"         => "localhost",  
    "login"          => "root",  
    "password"       => "pass",  
    "default"        => "oxylusflash_template2",  
);
```

//mysql server or socket file
//mysql username
//mysql password
//database name

ON THE FIRST RUN THE SITE WILL IMPORT THE DATABASE DUMP BY ITSELF.

Step 3 - Setting Folder Permissions :

Please set **chmod 777** on the following folders (view FAQ section for chmod help):

- ./upload*
- ./upload/ about*
- ./upload/banners*
- ./upload/clients*
- ./upload/contact*
- ./upload/galleries*
- ./upload/guestbook*
- ./upload/homepage*
- ./upload/music*
- ./upload/pages*
- ./upload/portfolio*
- ./upload/resumes*
- ./upload/services*
- ./upload/skins*
- ./upload/tmp*

Step 4 – First Run :

Congratulations, you're almost done ! After you follow the first 3 steps the template with cms should be properly installed on your web server.

In order to access the admin panel, please use the the url/location and login info provided below

Default log in info :

(you can change the login info inside the admin – *recommended!*)

Username : admin

Password : test

Admin panel location :

http://sitename/admin/

(meaning wherever you upload the template, just add a /admin/ in the url to access the admin panel)

Step 5 (optional) – Setting up the HTML site version for SEO :

If you are using an apache web server (linux hosting) and it reads .htaccess files then there is nothing you need to do. (open www.yoursite.com/googlemap.xml) to see if it works. In case it doesn't show an xml with all the links in your site then you need:

1. If the site isn't in the web site root rather it is in a subfolder, please open the .htaccess file and add the paths

```
ErrorDocument "404" /redirect.php
```

And change to :

```
ErrorDocument "404" /subfolder/redirect.php
```

2. If the .htaccess its set up correctly then your server doesn't read it. In this case you need to redirect all 404 errors to redirect.php using the hosting panel (this is if you are using windows based hosting). If this doesn't work either please contact your hosting support and ask them to do this redirect for you, it's an easy edit.

To preview the html version disable the java script support in your browser and then open your site at it's normal url. (ex. yoursite.com)

Admin/Front end files location

1. All php files for all modules for this templates are located in ./admin/modules/oxymall/plugins/ admin.*.php files are loaded by the admin panel while site.*.php files are loaded by the front end.
2. The admin interface (forms, listings, searches etc) is generated from all the xmls located in ./admin/modules/oxymall/plugins/forms/
3. The front end xml templates are located in ./admin/modules/oxymall/plugins/templates/

For admin usage tutorials, please check out the following video Tutorials:

Frequently Asked Questions

1. The changes I make in admin don't appear on the site.

If you uploaded **both** the content of 2 - Template-Preview XML and 3 - Template with Admin Panel you need to delete the install and do a fresh one with the ***only*** the files from 3 - Template with Admin Panel. The swf files for the version with cms are located in **upload/skins/<skin-code>/*.swf**. If you want to update the swf files upload them here by themselves, without any of the other files in 2 - Template-Preview XML folder.

If you only uploaded the content of 3 - template with Admin Panel and are getting this problem, you must clear your browser cache as the xml aren't refreshed automatically.

2. When you run the frontend or the admin panel you get the following mysql error:

Warning: mysql_connect() [function.mysql-connect]: Access denied for user '*@*****' (using password: YES) in '***\admin\lib\site.php' on line 11**

Warning: mysql_error() expects parameter 1 to be resource, boolean given in '*\admin\lib\site.php' on line 11**
CDatabase::Connect() error

You put the wrong login info in admin/mysql.php (mysql database user name, password or server host). Please recheck the information and make sure it's correct.

3. When you run the front end or the admin panel you get the following mysql error:

Cdatabase:SelectDB() error.

Same as above, you put the wrong database information in admin/myql.php

```
$_CONF["database"] = array(
    "type"           => "mysql",
    "server"         => "localhost", //mysql server or socket file
    "login"          => "root",      //mysql username
    "password"       => "pass",     //mysql password
    "default"        => "database", //database name
);
```

4. I can't upload any kind of files in admin, and I receive php errors.

Make sure you **chmod 777** the upload folder and all of its subfolders.

5. How do I "chmod" a file ?

The chmod value of a server-side file dictates the properties of that file (Read/Write/Read+Write/Execute etc.). Our admin panel needs to be able to write in the upload folder in order to function correctly.

If you are unfamiliar with chmod, we suggest you download **Total Commander** (free) from <http://www.ghisler.com/download.htm> and install it. Open it up, connect to your server via FTP, select the folder **upload** then go in File->Change Attributes-> Set the value to 777 and press Ok. Repeat the same operation for all subfolders in upload/. You can of course use any other software as long as it can give chmod commands, we just love TC :)

6. I can't upload files larger than 2MB.

By default (after installation) **PHP** is set up to accept files up to 2MB. To be sure this is the source of the problem create a file called "phpinfo.php" with the following content:

```
<?php
    Phpinfo();
?>
```

Upload the file in the site root, and then open the link <http://www.yoursite.com/phpinfo.php>.

Search for **upload_max_filesize** and **post_max_size**. These values should be set to more than the file size of what you are planning to upload (50MB or more should be ok), depending on your needs.

You have the following solutions :

Make a file called **php.ini** with the following content:

```
upload_max_filesize=200M
post_max_size=200M
memory_limit=128M
```

Upload the file in site root and in admin/ then reload the phpinfo link. If the values are the ones from php.ini then your problem is solved.

If this won't work, you need to contact your hosting support and ask them to increase the values for those fields.

7. I found a bug, what do I do next ?

First please go on our support forum and make sure you installed the latest updates and fixes from the following thread <http://forum.oxylusflash.com/slick-full-website-template-cms-2-skins/4156-fixes-updates-v3.html> . If you did so and the problem still persists please search the forum to see if anyone faces something similar (its no pleasure for us to answer the same question over and over again), and unless you find a similar thread, please post a new one outlining the issue you're experiencing. It's recommended to tag it properly so the right person answer you asap (CMS / INSTALL / FLASH). We also recommend attaching screenshots or providing us with links if possible.

Enjoy this file from Oxylus Flash !
